

When unwrapping

After 1-3 weeks

Final patina

FLAME FIREBOWL

The intimate bonfire starts with Flame fire bowl. It is easy to set up on the beach or in the garden and sets the scene for a cosy evening in the glow of the dancing flames. The sculptural brazier is made of Corten steel, a weatherproof type of steel that patinates in a short time and creates a protective layer on the outside. The stable foot is formed by two laser-cut frames that makes it stable and functional on places otherwise unfit high temperatures. The Firebowl has not started patinating when purchasing. It takes 1-3 weeks after unpacking to achieve the full patina.

Sellings points

- Corten steel degrades up to 8 times slower than mild steel, due to its ability to create a protective layer of rust on the surface.
- The bottom stabilizes the fire bowl and ensures that the surface on which it is located is not subjected to high temperatures
- Flame is easy to assemble, it is movable and easy to clean after use.
- Flame is not corroded when bought - the process takes about 1-3 weeks after unwrapping.
